

Schneider ~~had~~ ^{could speak of} ~~had spoken of~~ told about diglycol, Prestone's explosive brother; Ambros ~~had spoken of~~ pretty yellow dresses spun from the bark of his Ethylene tree; and he, Krauch, might remind the court that "toluol", a Four Year Plan product, drawn from methanol, which went into the making of TNT, would also yield saccharine for your afternoon tea. Erhard Milch, who had left the Aviation Ministry to join the Armament Ministry under the Four-Year Plan, took the stand to confirm Krauch's explanation:

Q Mr. Milch, these products as such are not suitable for war use?

A No, of course not.

Q I have a bottle of diglycol here. Can I use it in any form without danger of injury?

A I would not advise you to drink it, but you can try it. Not much will happen.

Q The same is true of other substances, like toluol? They are also not dangerous in themselves?

A Yes.

Q Mr. Milch, were these substances used for war purposes? Were they used for powder and explosives?

A As preliminary products, yes.

Q Who produced these powders and explosives?

A The powder and explosives factories.

Q Did they belong to Farben?

A They belonged to various explosives concerns.

And half the time, it seemed, Professor Krauch wandered on the Unter der Linden between the Chancellery and the Vermittlungsstelle Wehrmacht, not knowing whether he was saccharine or TNT. In Farben he was kicked upstairs beyond the Management, and in the Government promoted to a lonely eminence from which he could not act. His old friend, Milch, understood that unhappiness, too. Mr. Sprecher was curious.
