

for driving trucks and tanks. The benzine was better than the natural benzines. And the Farben Vorstand planned for 1939, the following year, five million tons of fuel, and a half-million tons of lubricants, for railways, trucks, for ship motors. An inspiring industrial saga, save for the documents which gave "raw materials" a martial tone. Like one reference to the bauxite as being imported "from the enemy," and a curious new system of bookkeeping which demonstrated that no line had been drawn between war goods and peace goods. "Rubber," said a Farben executive, "is one of the most important raw materials of the entire military and war economy." He listed the articles without distinction of use: tires, gas-mask materials, accumulator boxes, proofed materials, hosepipes, dinghies, washers, cable, tank covers. Dr. Ernst Struss said in a speech early in that amazingly productive year, 1938:

"It is out of the question that Germany will run the risk of a similar situation (sanctions such as had been threatened against Italy for invading Ethiopia). Especially I.G. has developed the necessary processes."

But as Krauch lectured the Tribunal, these military details seemed like the sayings pupils had scribbled after class on the Professor's chalk-talk: inerrigible, unjust afterthoughts. "I have never denied the fact of rearmament. It was a very important program of the Government. But armament is not necessarily a sign of aggression."

"Dr. Krauch, you stated that you complied with war-emergency measures because of —————> patriotic reasons?"

"Yes."

"In your activity as Plenipotentiary General, did you promote scientific research?"

"Of course. I believe that this activity was the only one which gave me some joy of living during my entire activity in Berlin."

He had been in a most unhappy position. He had consoled
IN BERLIN, HE SAID, HE
