

or Navy? On the surface at least, he wanted only to "prime the pump" when he went with the Government. His first job under Goering had been as "Director of the Office of Raw Materials and Synthetics." If Farben was his principal support, again on the surface it appeared that his new job under the Four-Year Plan was much the same. For years Germany had depended on the outside world for 70% of her raw materials. Largely due to his genius, within two years after the Four Year Plan began, the chemistry of I. G. Farben, encouraged through successive regimes since 1927, gained for Germany more than half her economic independence. ~~How~~ ~~could the Prosecution deny this?~~ The Defense introduced the official Nazi magazine, Voelkischer Beobachter, for July 1938, wherein Dr. Fritz H. onnenbruch had paid tribute to the amazing achievements of the preceding years:

*Underline
SINGLE-SPACE*

What the chemical industry is today is ~~very~~ evident from the fact that it, above all, has succeeded in securing national independence in raw materials, an accomplishment which previously, had frequently been considered impossible. The value of chemistry to the German national economy cannot be expressed in terms of money, any more than the price of a glass of water to a person who needs this water urgently for the preservation of his life.^a

Farben had given more than water to ^a parched economy. The German farmers had been losing 100 million Reichsmarks every year from the spoiling of green foods and from animal and vegetable parasites. In recouping the farmers' losses, Farben was "absolutely leading." In the first year of the Four-Year Plan, its factories ~~at~~ stepped up the production of cheap fertilizers and insecticides to halt crop-deaths. ~~The~~ ^{One} factory made preservatives for green foods. The farmer's wife, always an industrious canner, had lacked paraffin, and from the coal of the Ruhr, ^a the Farben factory ~~at~~ ~~made~~ made more paraffin than all the farmers' wives needed - - then made new foods from the leftover paraffin .

TP The average German citizen used 10 kilos of textiles per year, and in 1932, 9 out of 10 kilos had been imported. Farben went
