

~~designed to show that to the cost of the final rubber product, buna added only a few pennies,~~
these few "to carry these ideas ad absurdum," ^{said ILGNER} we did a work on the question, 'Can Europe Be
Self Sufficient?' American economists answered that question "No." And American businessmen
were agreed that Europe couldn't attempt even in a limited way to supply all her own food,
clothing and ~~industrial~~ industrial needs without extreme government controls. ^{TP} Ilgner's monograph
also answered the question "No." Quite apart from the issue of government control, Farben got
more than half its income from exports beyond Europe. But pennies could price Farben out of
the market. Even the Jasco agreement, dividing the petroleum and chemical worlds, could not
give to Standard Oil either a synthetic rubber or ~~a synthetic~~ gasoline which could be sold in
great quantity at a reasonable price. ^{SINCE 1903,} For ~~years~~ years, the aspirins and dyes had been paying
the huge experimental costs of all the hydrogenation processes, and while Standard Oil and
the rubber companies had offered to share those costs, the only important offers they had made
meant, in effect, that Farben must relinquish half its processes outright to keep the other
half. ^P Understandably, Farben wanted to license only the sale of most of its finished products,
while keeping its secrets of production. That was the traditional Farben policy. But millions
were tied up in the hydrogenation processes. They were making billions, ^{yet} but it would be very
bad business to go on subsidizing the hydrogenation products ^{that} would face for years to come
a market which consistently underpriced them. The crisis arrived a few weeks before Hitler came
